

# Pellet Implants

## Hormone Replacement Therapy

Are pellet implants right for you?

Since 1938, testosterone replacement via implantable time-release pellet has proven to be one of the most effective forms of testosterone delivery.

Learn why today!

## The evidence supports hormone replacement with pellet implants...

Data supports that hormone replacement with pellet implants is an effective method to deliver bio-identical hormone replacement in both men and woman. Pellets are implanted under the skin by a physician. The procedure takes 10-15 minutes. Within days, consistent, continuous release of small physiologic doses of hormones occurs. No injections and no creams to worry about. The pellet normally lasts 3-4 months. Pellet implants have been used since 1938, and are proven to be safe and effective. With pellets, patients rarely need to worry about possible side-effects often seen with injections, creams and patches (See chart top-right). Although pellets have been around since the 1930s, they lost momentum during the 1970s because of larger appeal of synthetic oral hormones. As negative side-effects were encountered with oral hormones, pellets have made a comeback along with other natural bio-identical hormone therapies. Hormones from pellets are the identical molecular structure to those naturally occurring in the body.

### Pellet Facts

- Size** Each pellet is approximately the size of a grain of rice.
- Duration** Pellets usually last 3-4 months. In some cases up to 5 months.
- Safety** Pellet implants have been done since the 1930s. It's safe & effective.
- Procedure** Small incision. Only 10-15 minutes in the doctor's office.
- Efficacy** Considered one of the better delivery systems for hormone replacement.

Our physicians have been doing pellet implants for many years. Pellet implants can give you the best continuous release of bio-identical hormones.

## Benefits of Pellet Implants in Men and Women...

For over 70 years, research has shown the benefits of pellet implants in men and women.

- Pellet implants deliver consistent, physiologic levels of hormone replacement.
- Proper consistent and physiologic dosing has shown an increase in bone density.
- Pellet implants bypass the liver and don't negatively impact clotting factors, blood pressure, lipid levels, glucose or liver function as other modalities may.

Pellet implants have consistently been shown to improve:

- Body composition, bone density
- Sex drive and libido
- Exercise endurance and recovery
- Mood, confidence, well-being
- Joint aches and pains

### What is hormone replacement therapy?

We use an individualized approach to hormone replacement therapy. With bio-identical hormone therapy, we aim to optimize a person's hormone levels to optimal ranges. Bio-identical hormones are identical at the molecular level to your own hormones. When hormone levels are lower or higher than optimal, the body is in a suboptimal state. We work to help you get all your levels optimal, so your body functions better. Results can occur within days following treatment.

## Aging can be managed. Don't settle for less.

Are you managing your aging process? If not, you should be. At the Anti-Aging and Wellness Clinics in Costa Rica, Mexico, and Panama, we focus on helping patients manage aging. Through the latest evidence-based research using, HRT, diet, and exercise, you don't have to settle for less. There has never been a time in history where we've had the power to do so much in this area of health and wellness.

With bio-identical hormone replacement therapy, proper diet and exercise, you can look and feel years younger. Enjoy aging with a healthy lifestyle devoted to health, quality of life, and longevity.
